More Notes on LVDTs

1. Applications
   1. Cryogenic to 650°C
   2. Harsh environments: high vibration/shock, radiation, etc.
   3. Examples: aircraft, satellites, nuclear reactors, automation, etc.

2. Advantages
   1. Very simple construction
   2. Little if any mechanical wear → lasts a long time

3. Drive Frequency
   "60 Hz common"
   "400 Hz common" in aircraft applications
   Phase delay issue worse at lower frequencies

\[ \text{Vin} = \frac{R_L}{3} \frac{V_p}{\text{swL}} \]

4. Operational Range
   - Minimum: less than 1 μm
   - Maximum: \( \pm 0.5 \) m

5. RVDT - Rotary Variable Differential Transformer
   → Similar concept to LVDT
   → Measures angular displacement of a shaft
GHSA/GHSAR 750 Series
Spring-Loaded AC LVDT Position Sensors

Spring Loaded LVDTs > General Purpose LVDTs > GHSA/GHSAR 750 Series

Features
- Ranges of ±0.050" to ±1.200" (±1.25 mm to ±30.50 mm)
- Repeatability of 0.00005" (±0.6 µm)
- Non-linearity of ±0.25% of FRO or better
- In-line connector (GHSA) or radial through-bore (GHSAR); mating plug for connector included
- Low pressure air-extend/spring-retract version available (GHSAR 750-A)
- Environmentally sealed to IEC IP-68

Applications
- Industrial gaging systems
- Electronic dial indicators
- Fabricated metal products gaging
- Materials testing apparatus
- Large shaft TIR measurements

GHSA and GHSAR 750 Series of 3/4 inch (19 mm) diameter AC LVDTs are designed for a wide range of position measurement applications. These rugged hermetically sealed sensors are constructed entirely of stainless steel, and are intended for general industrial use. The coil windings are sealed against hostile environments to IEC standard IP-68 and input/output connections are made through a sealed axial (GHSA) or radial (GHSAR) connector. The radial connector offers two important benefits. First, it results in a through-bore design, which allows for air purging of the sensor's bearings to remove potential contaminants. The second advantage is shorter installed length compared to units of the same range with axial connectors. The mating connector plug is supplied with the unit.

The sensor consists of a spring loaded shaft running in a precision sleeve bearing and connected to the core of an LVDT. The use of a precision sleeve bearing results in measurement repeatability of ±0.00005 inches (±0.6 µm) or better. The output from the LVDT can be connected to any standard LVDT signal conditioner and then passed to a gaging column display, digital readout, or computer based data acquisition system.

The probe shaft is fully extended by a spring extending a nominal force of 6 to 20 ounces depending upon total range. The contact tip supplied is an AGD standard number 9 made from black oxide hardened tool steel. It is fully interchangeable with other 4-40 threaded AGD contact tips.

Macro Sensors also offers an air-extend/spring-retract version of the radial model. The GHSAR 750-A is designed for a wide range of cyclical position measurement and automated dimensional gaging applications where it is necessary or desirable to move the probe out of the way between readings. The shaft is extended by introduction of a low-pressure (10-30 psi), clean, dry air supply, with a regulated flow, through a 1/4 inch barbed fitting on the end of the unit. With the release of pressure, an internal spring returns the probe to its normal position.

Available in ranges of ±0.050 inch (±1.25 mm) to ±2.00 inches (±50.0 mm), the maximum linearity error for a GHSA or GHSAR Series sensor is ±0.25% of full range output using a statistically best-fit straight line derived by the least squares method.

For simplified mounting the GHSA and GHSAR 750 Series have a 1/2-20 UNF-2A thread on the front of the housing, permitting the user to install the LVDT in a mating threaded part or by using the two hex nuts furnished with the sensor. This results in a ready-to-use package for position measurements and longer range gaging applications.

All GHSA/GHSAR Series LVDTs will operate properly with any conventional differential input LVDT signal conditioners, but operation with radiometric LVDT signal conditioning is not recommended. Macro Sensors offers a full line of LVDT signal conditioners that will deliver optimum performance from any GHSA/GHSAR Series LVDT.

TYPICAL APPLICATIONS

- Flight control actuation / navigation
- Fuel control / valves
- Cockpit controls
- Nose wheel steering systems
- Missile fin actuation

FEATURES

- Brushless, non-contacting technology
- Repeatable position sensing with infinite resolution
- Housed and frameless versions available
- Single cycle (±80 deg.) or dual cycle (±40 deg.)
- Standard size 8 (housed version) with servo clamp interface available
- Multiple channel (tandem) versions available
- Geared configurations available

BENEFITS

- Long life
- High reliability
- High accuracy
- Repeatable performance
- Robust, compact construction
- Custom electrical and mechanical designs available – contact factory with requirements

Note: If your application requires gearing or other complex mechanical configurations, please provide us with your requirements.

A Rotary Variable Differential Transformer (RVDT) is an electromechanical transducer that provides a variable alternating current (AC) output voltage that is linearly proportional to the angular displacement of its input shaft. When energized with a fixed AC source, the output signal is linear within a specified range over the angular displacement.

RVDT's utilize brushless, non-contacting technology to ensure long-life and reliable, repeatable position sensing with infinite resolution. Such reliable and repeatable performance assures accurate position sensing under the most extreme operating conditions.

Moog offers seven frequency optimized RVDT's in a basic size 8 configured housing. Each is designed to operate at a specific frequency. Frequency optimization provides the benefit of an increased operating range of angular displacement with a reduction in sensor size and weight.

Please contact our application engineers for more information and to discuss your specific needs.
Analog Devices CN0301 Universal LVDT Signal Conditioning Circuit
Sinewave Oscillator: 20Hz to 20KHz (capacitor selection), 2\(V_{\text{rms}}\) to 24\(V_{\text{rms}}\)

+-BIN is the drive signal across the primary coil. It is synchronously demodulated with itself, producing a full wave rectified output that is then lowpass filtered

-ACOMP and +ACOMP is the voltage across the secondary coils. It is demodulated with a “phase delayed” version of BIN, +-AIN

A duty cycle divider calculates A/B in PWM that gets lowpass filtered to get \(V_{\text{out}}\)
PHASE LAG = Arc Tan (Hz RC);

PHASE LEAD = Arc Tan 1/(Hz RC)

WHERE R = R_S/(R_S + R_T)
